Your AI cheat sheet

Keep it handy in the session

wcb Workers' Compensation Board – Alberta | Deloitte.

The words we'll use

THREE KINDS OF AI

Predictive AI (machine learning): Learns patterns from past data to score or forecast
Like: The bank's unusual-purchase alert

Generative AI: Reads and writes: summarizes, answers, drafts
Like: Copilot drafting a reply

Agent: Pursues a goal by taking steps, using tools, memory and instructions
Like: An assistant that books the whole trip

HOW IT WORKS

Large language model (LLM): Predicts a likely next word, again and again; fluent, but has no built-in fact check
Like: Your phone finishing your sentence

Hallucination: A fluent, confident answer that isn't true
Like: The made-up leadership decision

Grounding: Answering from trusted sources, and showing them
Like: "It's on page 4 of the policy"

RAG: Retrieval-augmented generation: retrieve the right documents, add them to the question, generate the answer from them
Like: A summary with a source under each point

KEEPING CONTROL

Agent loop: Plan a step, act, check the result, repeat; stop when done, unsure, or approval is needed
Like: Flight, hotel, calendar, then a pause

Least privilege: Only the access the job needs
Like: It can hold a hotel, but can't spend from the company account

Autonomy dial: How much it may do alone: suggests, drafts, acts with approval, acts then reports, acts alone
Like: "Pay $1,860?" Approve or decline

Human in the loop: A person reviews or approves at the moments that matter, and stays accountable
Like: A person edits the draft, then sends it

Evals: Tests of an AI system, on cases like ours, before and after launch
Like: "99% accurate": on what tests?

Five questions for any AI pitch

"Our AI agent is 99% accurate, fully autonomous, learns your business, and plugs into all your systems."

1. **99% accurate?** On what tests, and on cases like ours? Show me the evals. (Evals)
2. **Fully autonomous?** For which tasks, and where does a person approve? (Autonomy dial)
3. **Learns your business?** From what data, and can it show where an answer came from? (Grounding)
4. **Plugs into all your systems?** What can it read, draft and do? Only what the job needs? (Least privilege)
5. When it's wrong, who notices, and can we see what it did? (Human in the loop)

If they can't answer, that is your answer.

Three questions to bring

1. Where does work wait the longest in your area?
Waiting is where AI usually helps first.

2. Which decision would you never hand to a machine, and why?
Your answer shows where a person must stay.

3. What would you need to see before you trusted an AI's answer?
A source, a test result, a person who checked?

83% of Canadian workers' compensation leaders surveyed say their maturity for integrating AI into core business functions is still low. Nobody is far ahead: what matters is where we choose to start.
Deloitte, The Future of Workers' Compensation (August 2026)
